## **HuBi1: The inside-out planetary nebula around a born-again star**

**Dra. Laurence Sabin y Dr. Christophe Morisset  
(IA Ensenada, UNAM)**

HuBi1 is a strange Planetary Nebula: around a 40,000K star that lost 10 magnitudes in last half century we observed an outer envelope showing only recombination lines and an inner shell with H $\alpha$  and [OIII] lines farther from the star than the [OII] lines. We will present the observations and our solution to this puzzling object
